

# ETC3550: Applied forecasting for business and economics

Ch2. Time series graphics OTexts.org/fpp2/

## **Outline**

- 1 Time series in R
- 2 Time plots
- 3 Seasonal plots
- 4 Seasonal or cyclic?
- 5 Lag plots and autocorrelation
- **6** White noise

A time series is stored in a ts object in R:

- a list of numbers
- information about times those numbers were recorded.

#### **Example**

Year	Observation
2012	123
2013	39
2014	78
2015	52
2016	110

y <- ts(c(123,39,78,52,110), start=2012)

For observations that are more frequent than once per year, add a frequency argument.

E.g., monthly data stored as a numerical vector z:

```
y <- ts(z, frequency=12, start=c(2003, 1))
```

- fma package (for lots of time series data)
- expsmooth package (for more time series data)

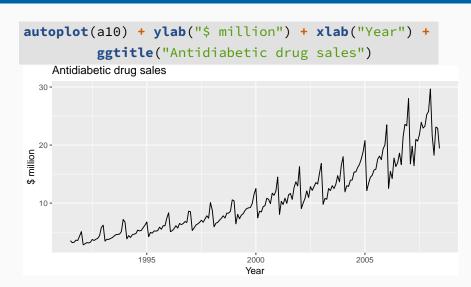

## **Outline**

- 1 Time series in R
- 2 Time plots
- 3 Seasonal plots
- 4 Seasonal or cyclic?
- 5 Lag plots and autocorrelation
- **6** White noise

## Time plots

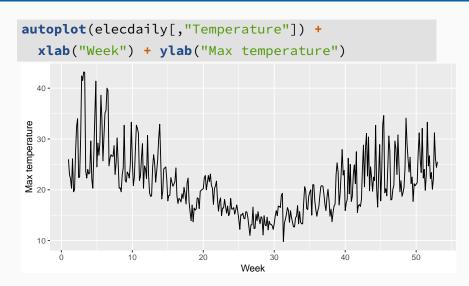

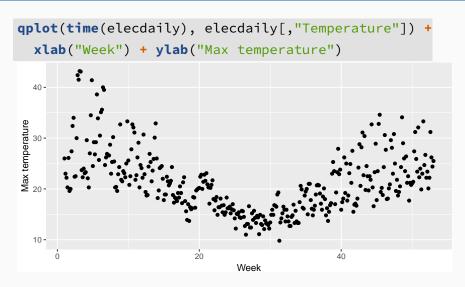

## Time plots

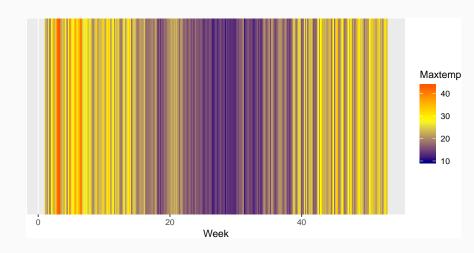

## **Your turn**

- Create plots of the following time series: dole, bricksq, lynx, goog
- Use help() to find out about the data in each series.
- For the last plot, modify the axis labels and title.

## **Outline**

- 1 Time series in R
- 2 Time plots
- 3 Seasonal plots
- 4 Seasonal or cyclic?
- 5 Lag plots and autocorrelation
- **6** White noise

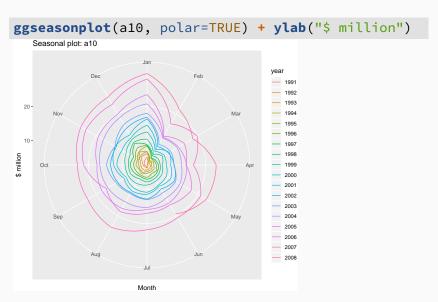

## **Seasonal plots**

```
ggseasonplot(a10, year.labels=TRUE, year.labels.left=TRUE) +

                                                                           Dec
                                          Month
```

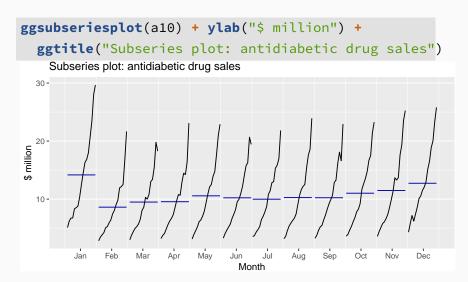

## **Seasonal plots**

- Data plotted against the individual "seasons" in which the data were observed. (In this case a "season" is a month.)
- Something like a time plot except that the data from each season are overlapped.
- Enables the underlying seasonal pattern to be seen more clearly, and also allows any substantial departures from the seasonal pattern to be easily identified.
- In R: ggseasonplot()

## **Seasonal polar plots**

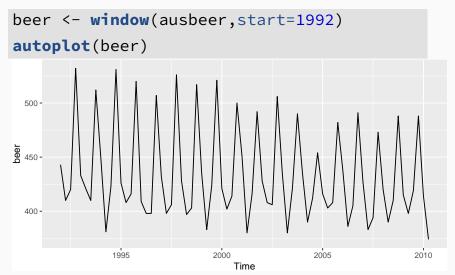

### Seasonal subseries plots

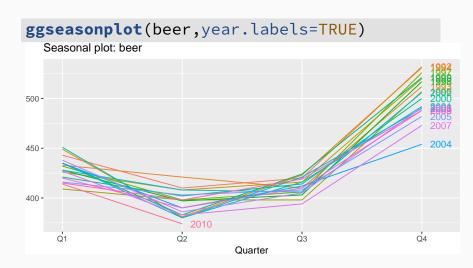

## Seasonal subseries plots

- Data for each season collected together in time plot as separate time series.
- Enables the underlying seasonal pattern to be seen clearly, and changes in seasonality over time to be visualized.
- In R: ggsubseriesplot()

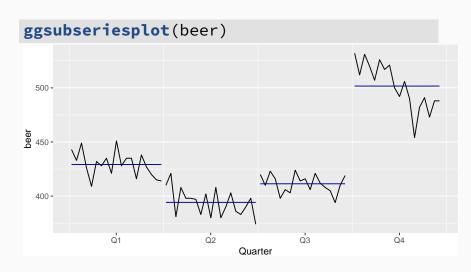

# **Quarterly Australian Beer Production**

# **Quarterly Australian Beer Production**

# **Quarterly Australian Beer Production**

#### Your turn

The arrivals data set comprises quarterly international arrivals (in thousands) to Australia from Japan, New Zealand, UK and the US.

- Use autoplot() and ggseasonplot() to compare the differences between the arrivals from these four countries.
- Can you identify any unusual observations?

### **Outline**

- 1 Time series in R
- 2 Time plots
- 3 Seasonal plots
- 4 Seasonal or cyclic?
- 5 Lag plots and autocorrelation
- **6** White noise

- **Trend** pattern exists when there is a long-term increase or decrease in the data.
- Seasonal pattern exists when a series is influenced by seasonal factors (e.g., the quarter of the year, the month, or day of the week).
  - Cyclic pattern exists when data exhibit rises and falls that are not of fixed period (duration usually of at least 2 years).

## Time series components

#### Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

# Seasonal or cyclic?

#### Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

# Seasonal or cyclic?

#### Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

The timing of peaks and troughs is predictable with seasonal data, but unpredictable in the long term with cyclic data.

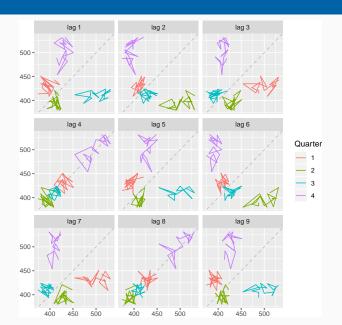

### **Outline**

- 1 Time series in R
- 2 Time plots
- 3 Seasonal plots
- 4 Seasonal or cyclic?
- 5 Lag plots and autocorrelation
- **6** White noise

# **Example: Beer production**

```
beer <- window(ausbeer, start=1992)
gglagplot(beer)</pre>
```

# **Example: Beer production**

## **Lagged scatterplots**

- Each graph shows  $y_t$  plotted against  $y_{t-k}$  for different values of k.
- The autocorrelations are the correlations associated with these scatterplots.

**Covariance** and **correlation**: measure extent of **linear relationship** between two variables (*y* and *X*).

**Covariance** and **correlation**: measure extent of **linear relationship** between two variables (*y* and *X*).

**Autocovariance** and **autocorrelation**: measure linear relationship between **lagged values** of a time series y.

**Covariance** and **correlation**: measure extent of **linear relationship** between two variables (*y* and *X*).

**Autocovariance** and **autocorrelation**: measure linear relationship between **lagged values** of a time series y. We measure the relationship between:

- $\blacksquare$   $y_t$  and  $y_{t-2}$
- $y_t$  and  $y_{t-3}$
- etc.

and

We denote the sample autocovariance at lag k by  $c_k$  and the sample autocorrelation at lag k by  $r_k$ . Then define

$$c_k = \frac{1}{T} \sum_{t=k+1}^{T} (y_t - \bar{y})(y_{t-k} - \bar{y})$$
$$r_k = c_k/c_0$$

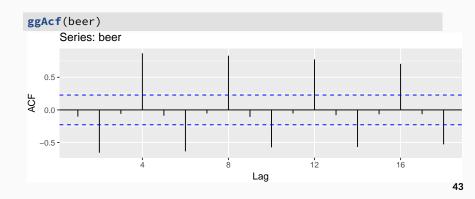

We denote the sample autocovariance at lag k by  $c_k$  and the sample autocorrelation at lag k by  $r_k$ . Then define

$$c_{k} = \frac{1}{T} \sum_{t=k+1}^{T} (y_{t} - \bar{y})(y_{t-k} - \bar{y})$$
and
$$r_{k} = c_{k}/c_{0}$$

- $\blacksquare$   $r_1$  indicates how successive values of y relate to each other
- $Arr r_2$  indicates how y values two periods apart relate to each other
- Arr is almost the same as the sample correlation between  $y_t$  and  $y_{t-k}$ .

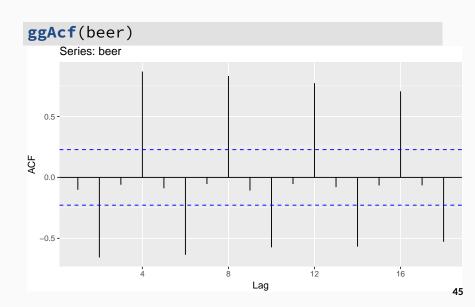

#### Results for first 9 lags for beer data:

r <sub>1</sub>	r <sub>2</sub>	r <sub>3</sub>	r <sub>4</sub>	r <sub>5</sub>	r <sub>6</sub>	r <sub>7</sub>	r <sub>8</sub>	r <sub>9</sub>
-0.102	-0.657	-0.060	0.869	-0.089	-0.635	-0.054	0.832	-0.108

- $r_4$  higher than for the other lags. This is due to the seasonal pattern in the data: the peaks tend to be 4 quarters apart and the troughs tend to be 2 quarters apart.
- $Arr r_2$  is more negative than for the other lags because troughs tend to be 2 quarters behind peaks.
- Together, the autocorrelations at lags 1, 2, ..., make up the autocorrelation or ACF.
- The plot is known as a correlogram

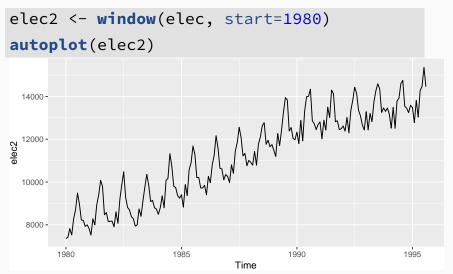

# **ACF**

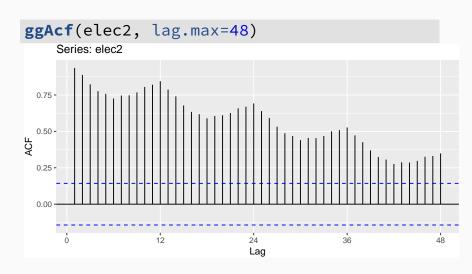

# Trend and seasonality in ACF plots

- When data have a trend, the autocorrelations for small lags tend to be large and positive.
- When data are seasonal, the autocorrelations will be larger at the seasonal lags (i.e., at multiples of the seasonal frequency)
- When data are trended and seasonal, you see a combination of these effects.

# Aus monthly electricity production

# Aus monthly electricity production

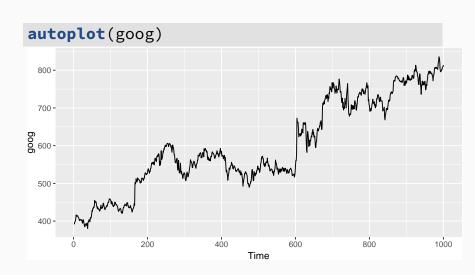

## Aus monthly electricity production

Time plot shows clear trend and seasonality.

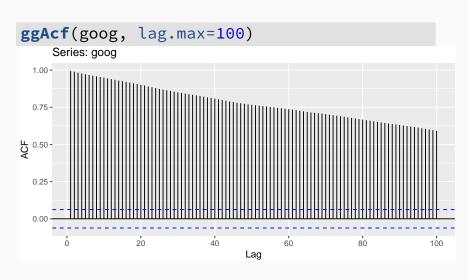

The same features are reflected in the ACF.

- The slowly decaying ACF indicates trend.
- The ACF peaks at lags 12, 24, 36, ..., indicate seasonality of length 12.

# Google stock price

## Google stock price

#### Your turn

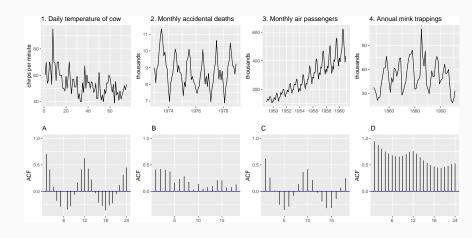

We have introduced the following graphics functions:

- gglagplot
- ggAcf

Explore the following time series using these functions. Can you spot any seasonality, cyclicity and trend? What do you learn about the series?

- hsales
- usdeaths
- bricksq
- sunspotarea
- gasoline

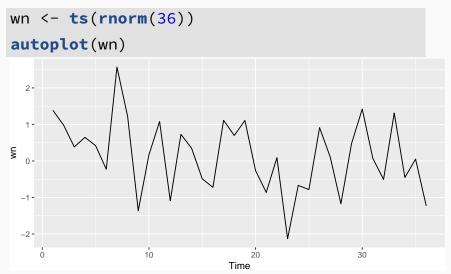

# Which is which?

### **Outline**

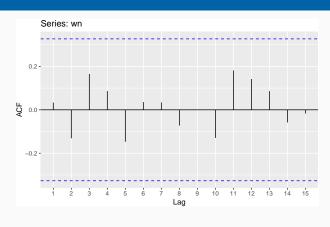

- 1 Time series in R
- 2 Time plots
- 3 Seasonal plots
- 4 Seasonal or cyclic?
- 5 Lag plots and autocorrelation
- **6** White noise

# **Example: White noise**

# Example: White noise

$r_1$	0.03
$r_2$	-0.13
$r_3$	0.17
$r_4$	0.09
<b>r</b> <sub>5</sub>	-0.15
r <sub>6</sub>	0.04
<b>r</b> <sub>7</sub>	0.03
$r_8$	-0.07
<b>r</b> <sub>9</sub>	0.00
<i>r</i> <sub>10</sub>	-0.13

Sample autocorrelations for white noise series.

We expect each autocorrelation to be close to zero.

## Sampling distribution of autocorrelations

Sampling distribution of  $r_k$  for white noise data is asymptotically N(0,1/T).

## Sampling distribution of autocorrelations

Sampling distribution of  $r_k$  for white noise data is asymptotically N(0,1/T).

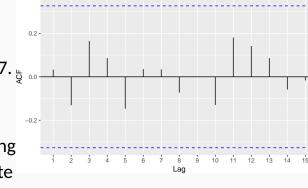

- 95% of all  $r_k$  for white noise must lie within  $\pm 1.96/\sqrt{T}$ .
- If this is not the case, the series is probably not WN.
- Common to plot lines at  $\pm 1.96/\sqrt{T}$  when plotting ACF. These are the *critical values*.

### **Autocorrelation**

#### **Example:**

T = 36 and so critical values at  $\pm 1.96/\sqrt{36}$  =  $\pm 0.327$ .

All autocorrelation

these limits, confirming that the data are white noise. (More precisely,

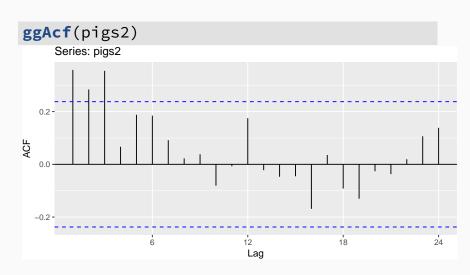

the data cannot be

coefficients lie within

distinguished from white noise.)

Series: wn

```
pigs2 <- window(pigs, start=1990)</pre>

                                                              1995
                                      Year
```

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 1990 through August 1995. (Source: Australian Bureau of Statistics.)

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 1990 through August 1995. (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows some significant autocorrelation at lags 1, 2, and 3.
- $Arr r_{12}$  relatively large although not significant. This may indicate some slight seasonality.

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 1990 through August 1995. (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows some significant autocorrelation at lags 1, 2, and 3.
- $Arr r_{12}$  relatively large although not significant. This may indicate some slight seasonality.

These show the series is **not a white noise series**.

#### Your turn

You can compute the daily changes in the Google stock price using

```
dgoog <- diff(goog)</pre>
```

Does dgoog look like white noise?
